AutoHealOps

Actual Project Evidence

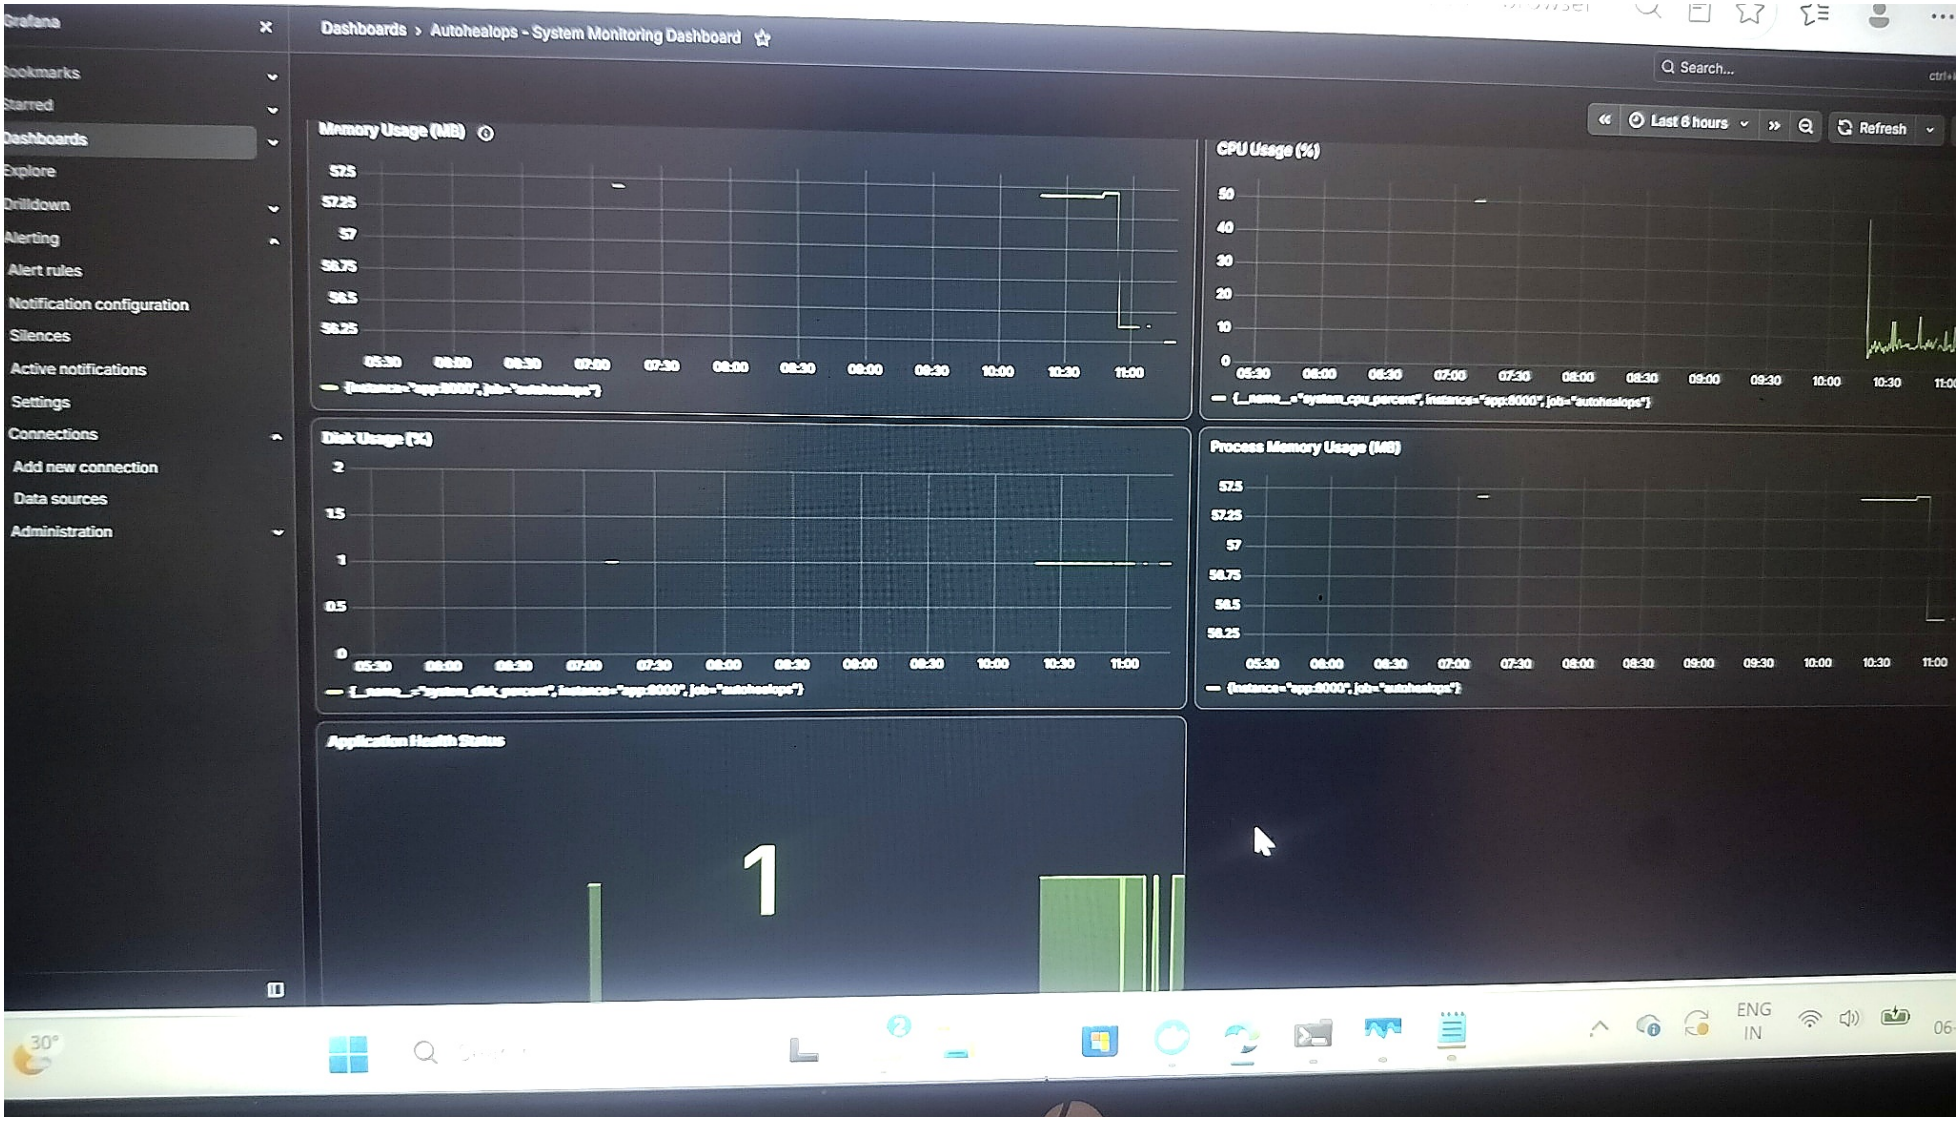

Monitoring • Metrics • Container Health • Self-Healing • Telegram Notifications

This document contains screenshots captured from the user's running AutoHealOps system. Images have been lightly cropped or enhanced for readability; dashboard data and terminal outputs are retained from the supplied screenshots.

Evidence set: 10 actual screenshots

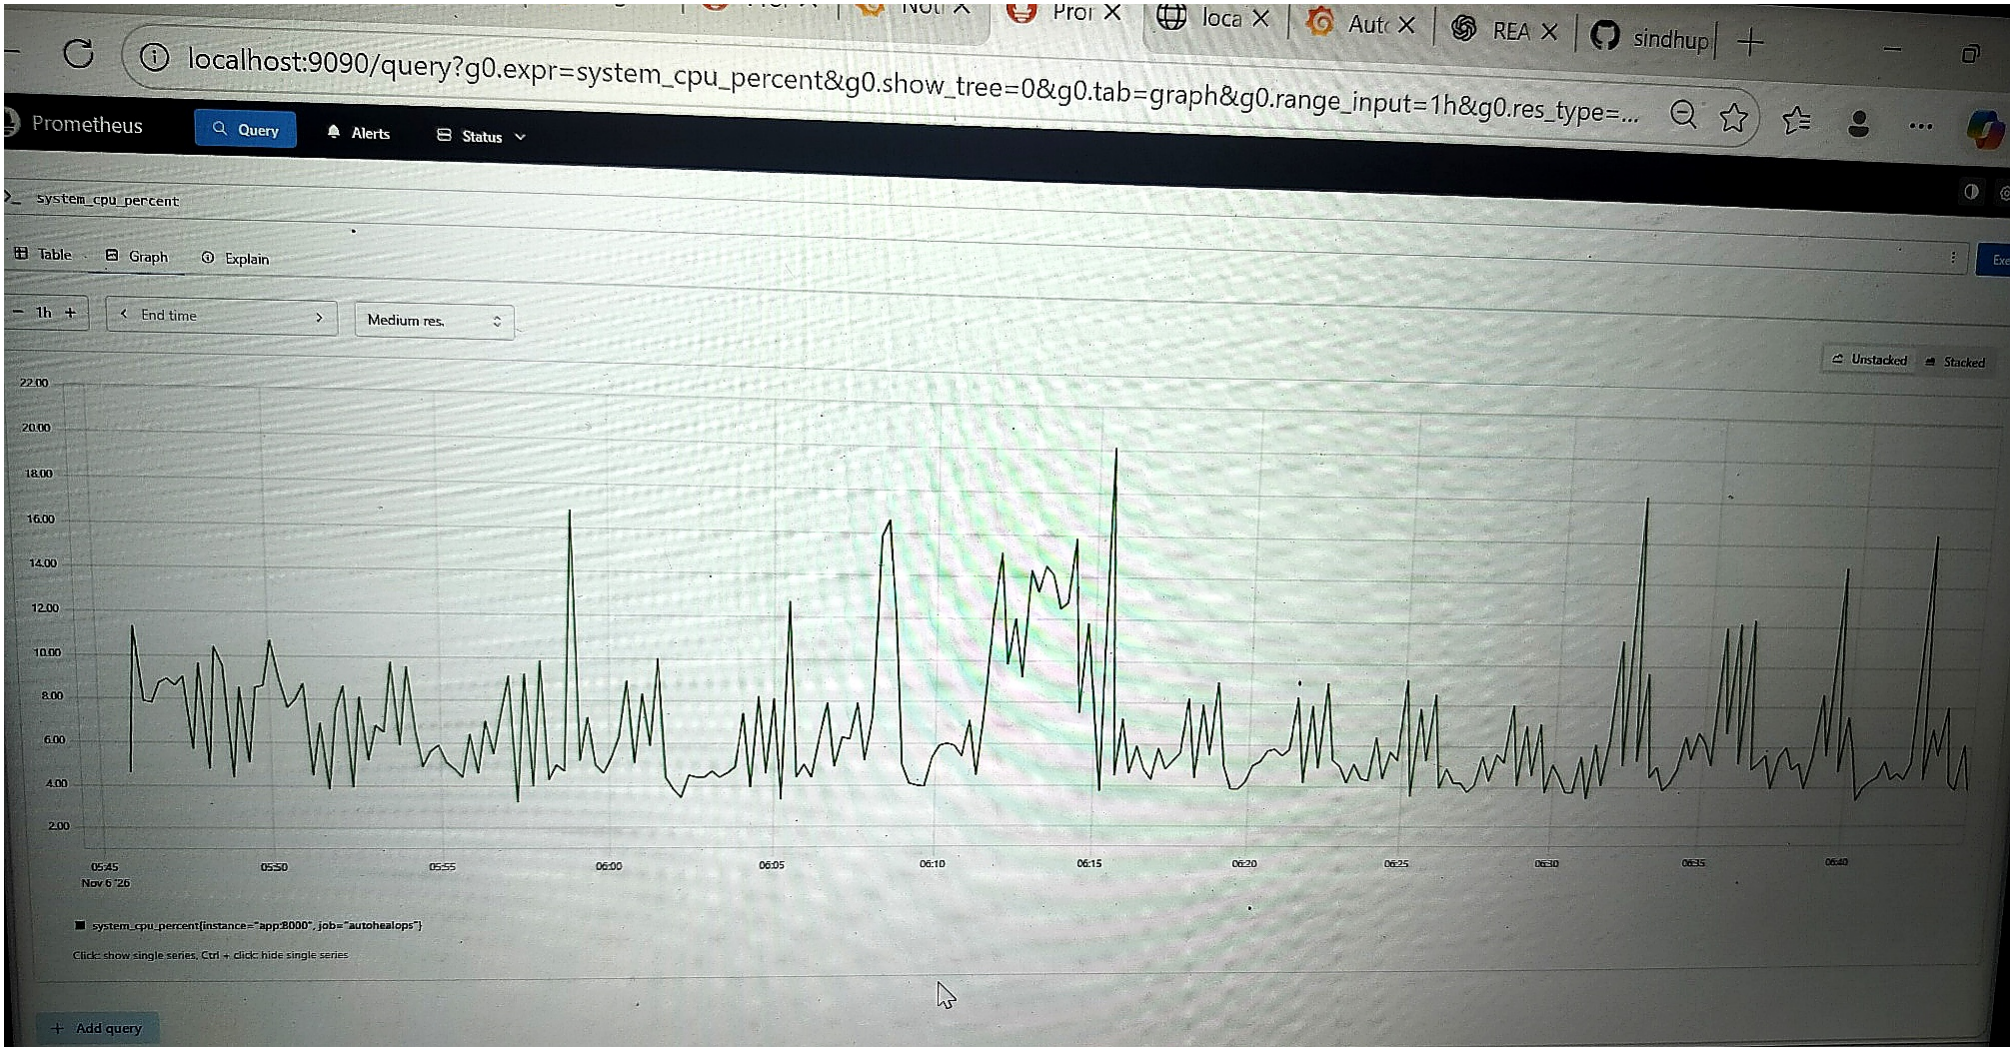

01. Grafana System Monitoring Dashboard

Actual AutoHealOps Grafana dashboard showing memory, CPU, disk, process memory, and application health panels.

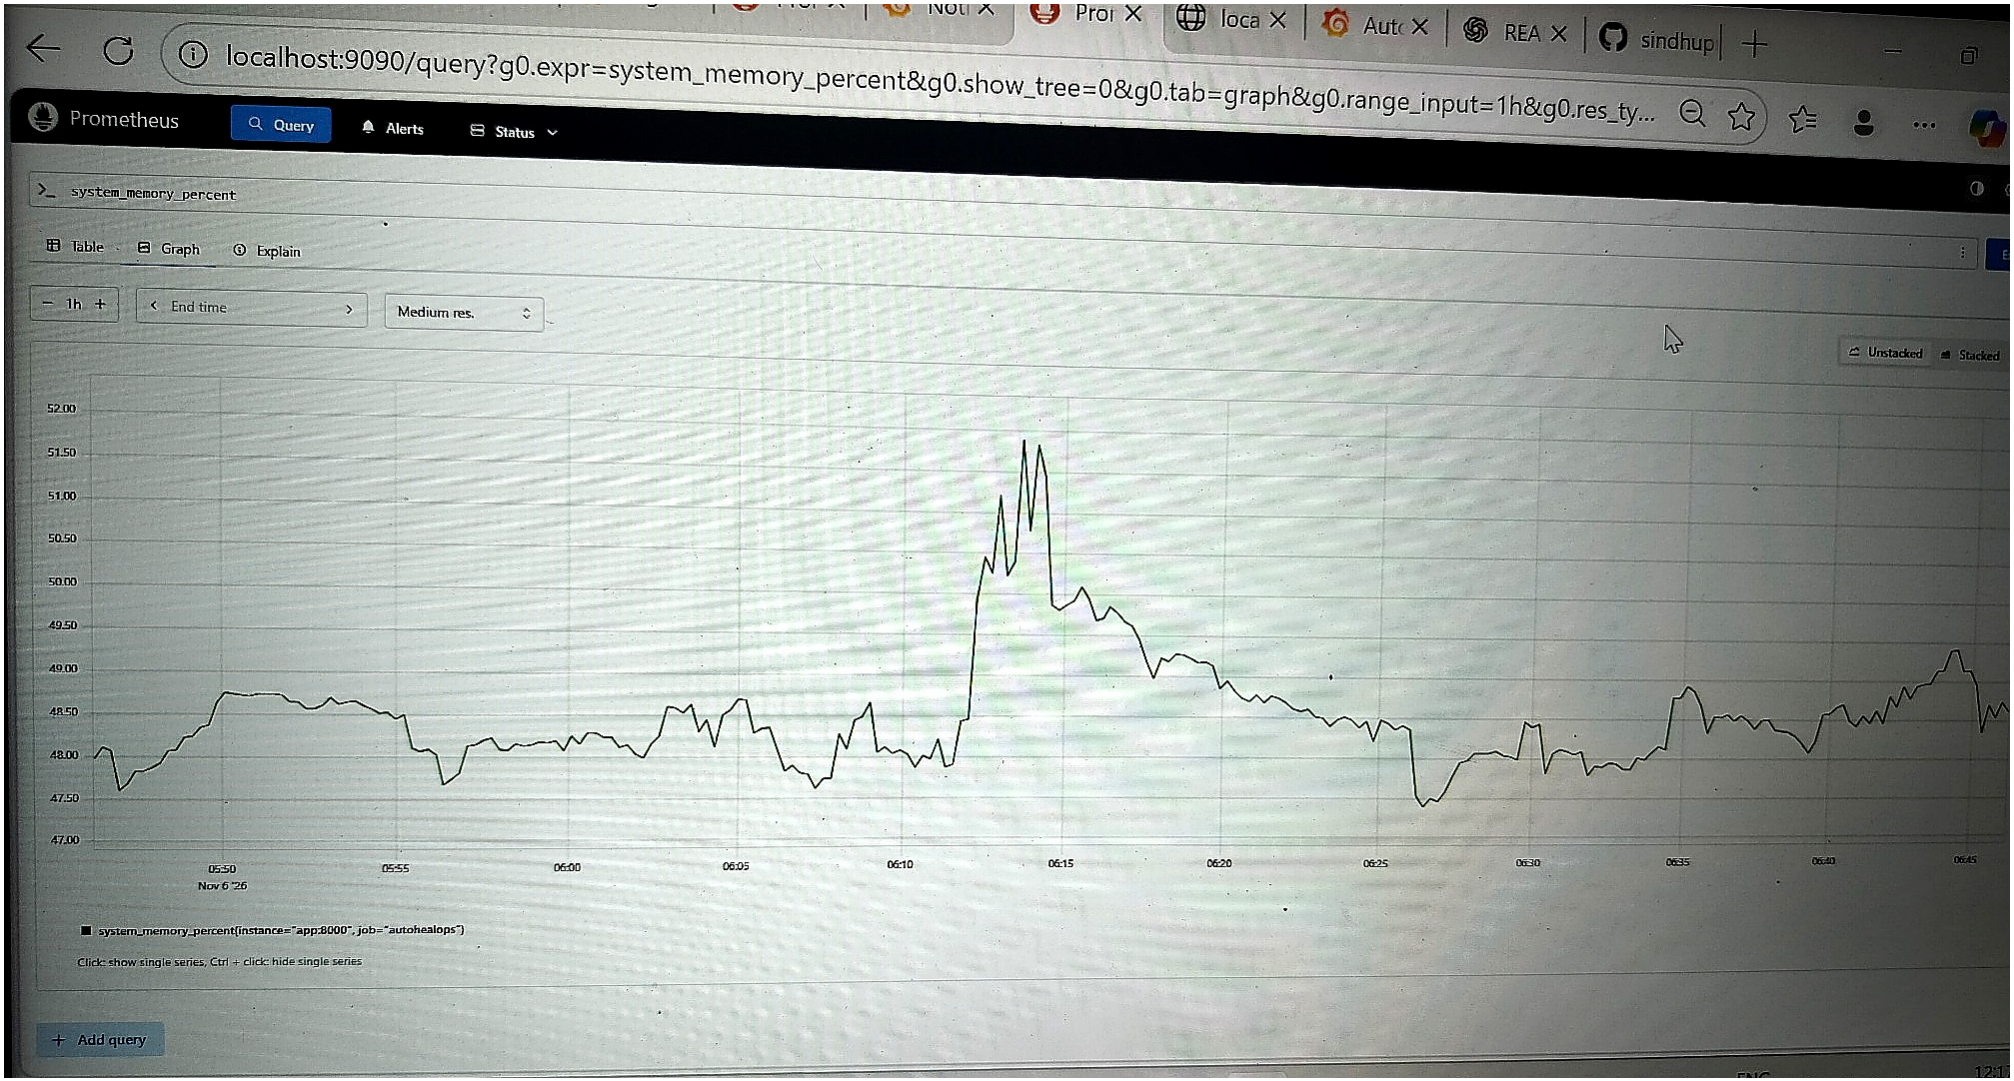

02. Prometheus CPU Metrics

Prometheus query: system_cpu_percent. The graph displays CPU usage measurements from the AutoHealOps application.

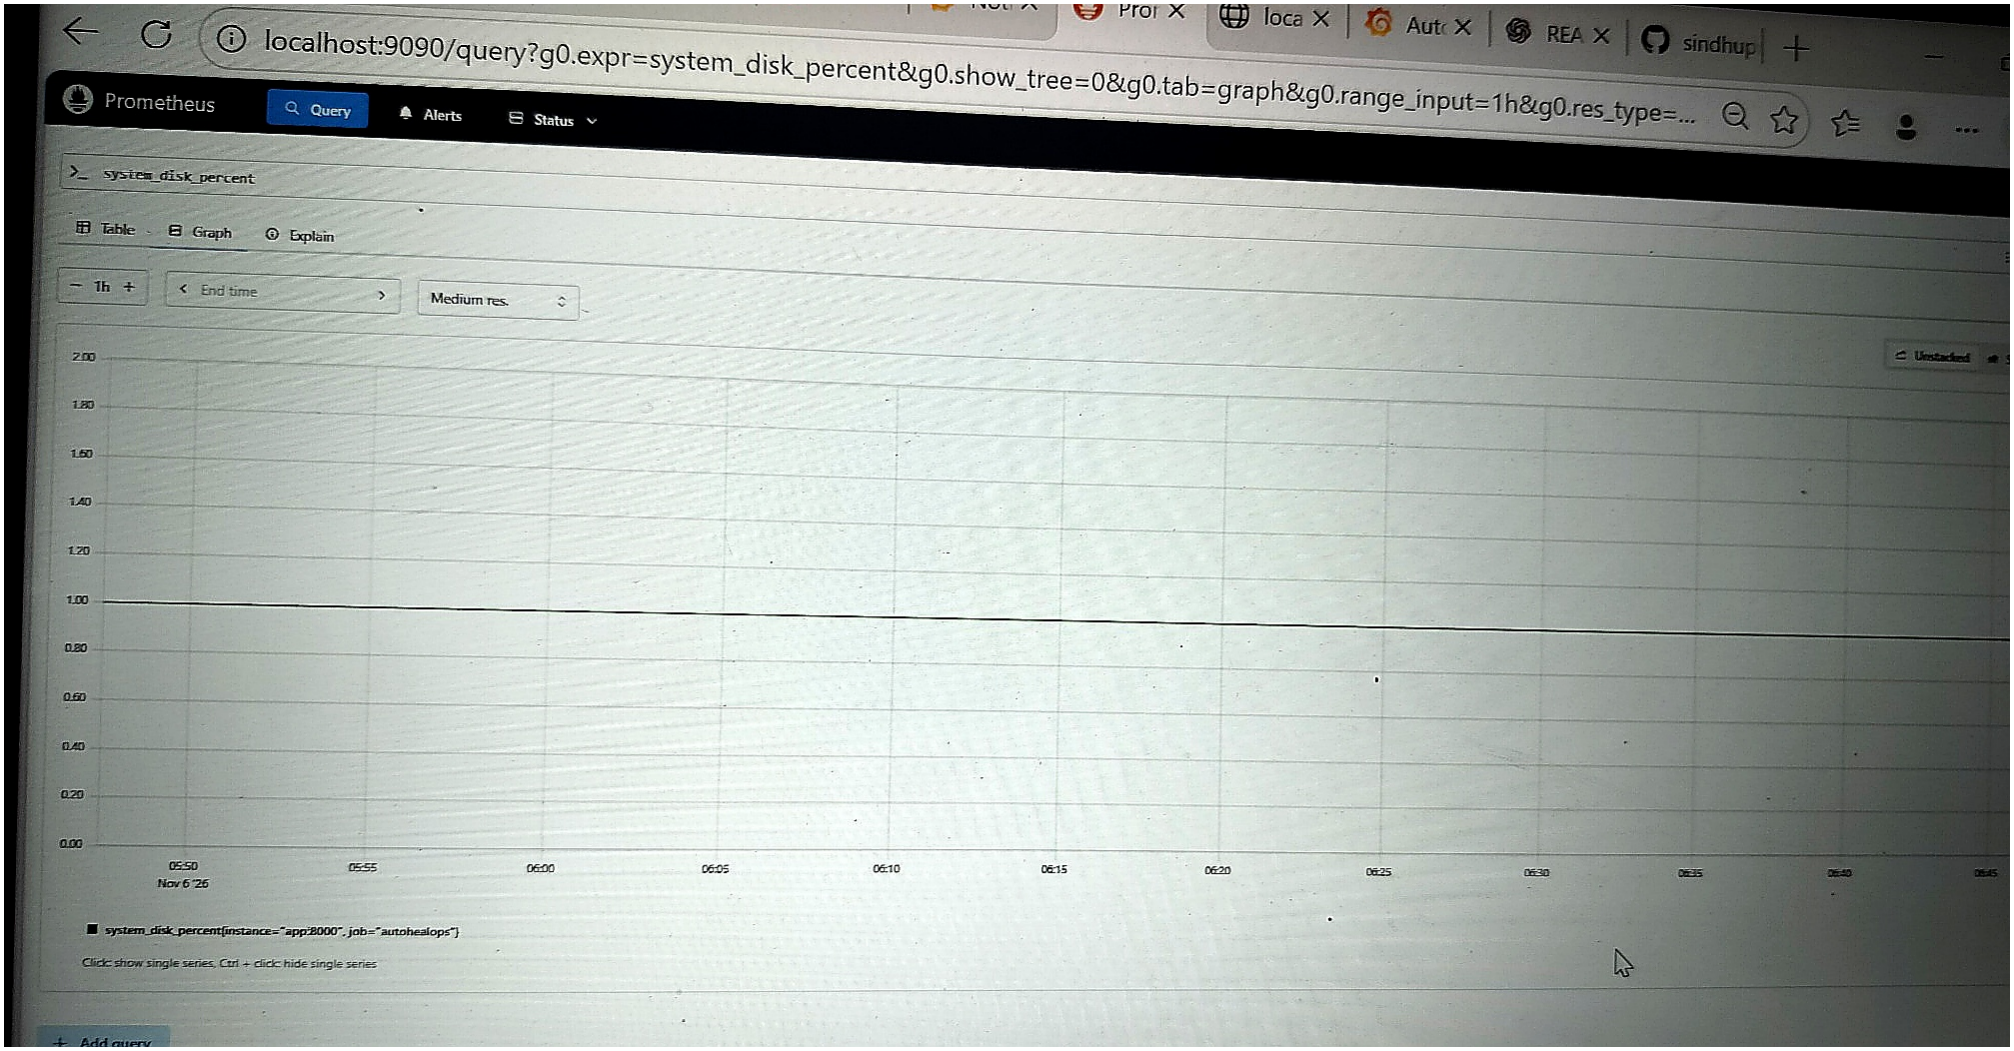

03. Prometheus Memory Metrics

Prometheus query: system_memory_percent. The graph displays the measured memory usage percentage.

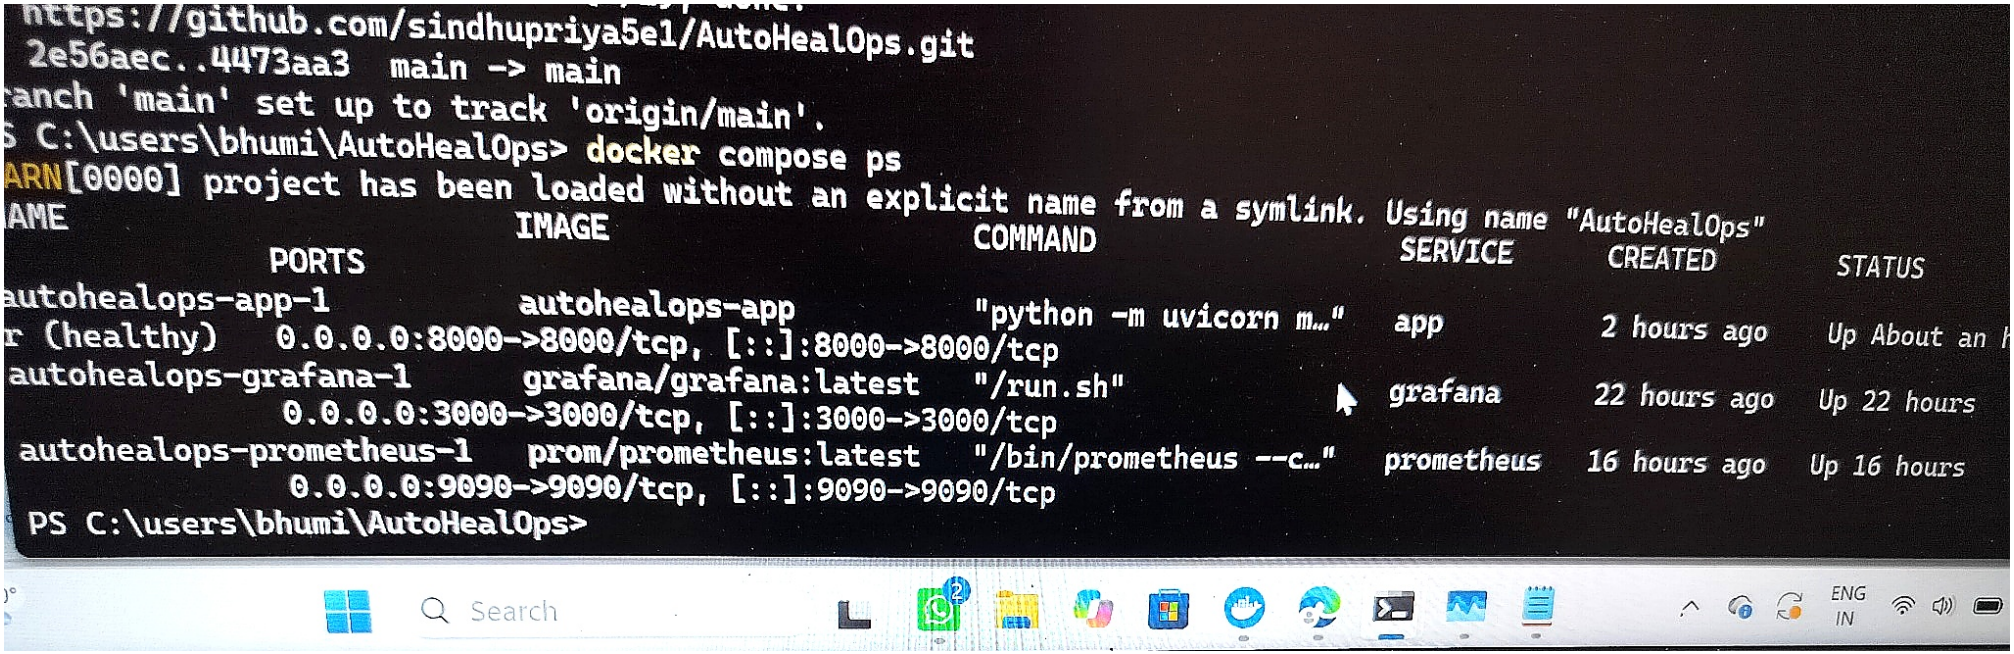

04. Prometheus Disk Metrics

Prometheus query: system_disk_percent. The graph displays the measured disk usage percentage.

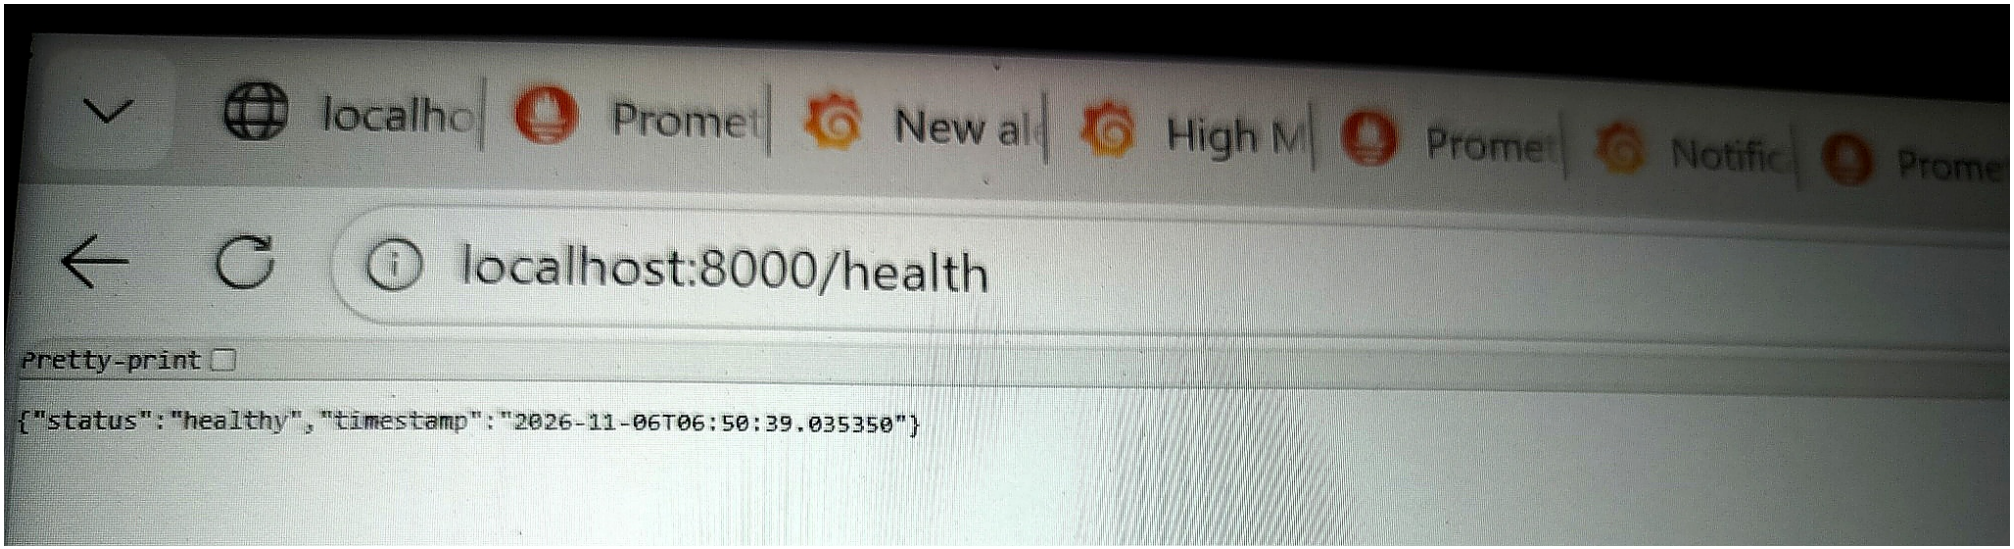

05. Docker Compose Service Status

Actual Docker Compose output showing the AutoHealOps app, Grafana, and Prometheus containers running; the app reports healthy.

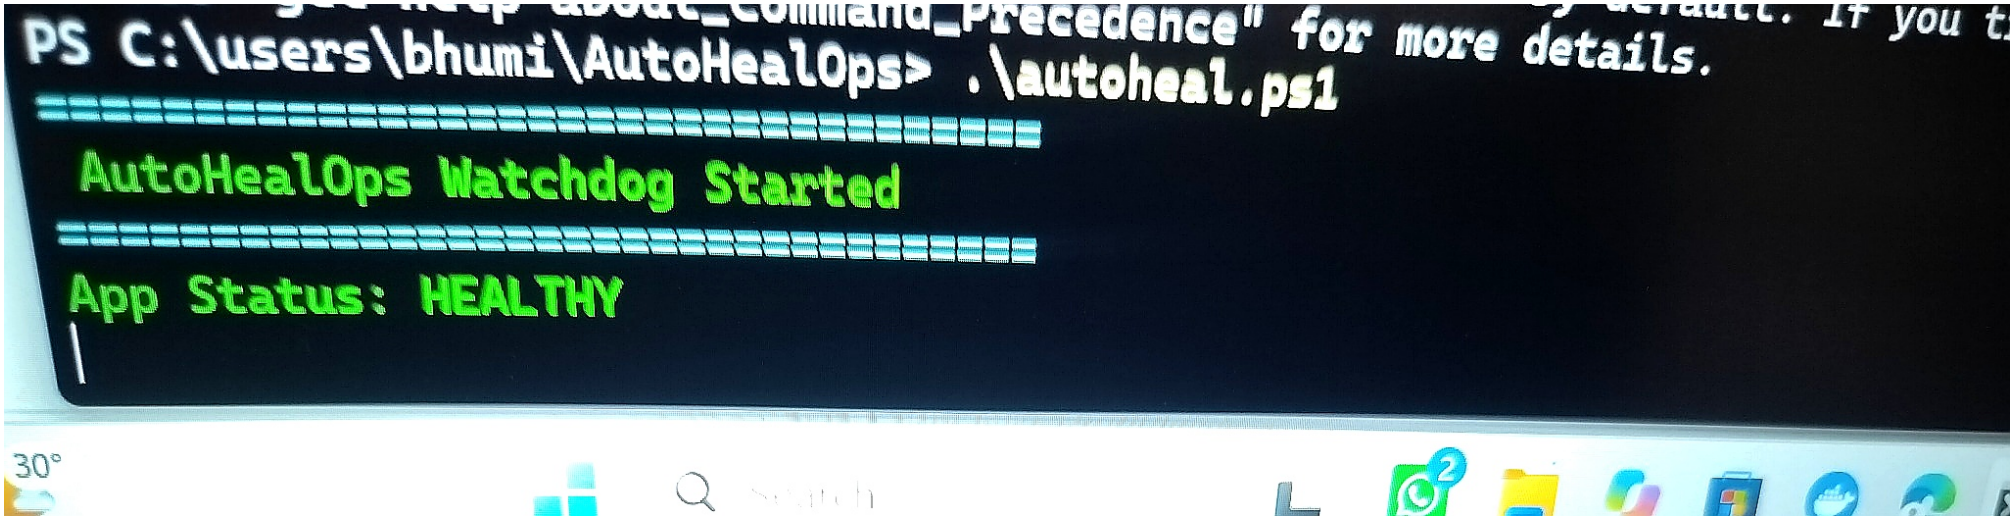

06. Application Health Endpoint

Actual response from http://localhost:8000/health showing status: healthy.

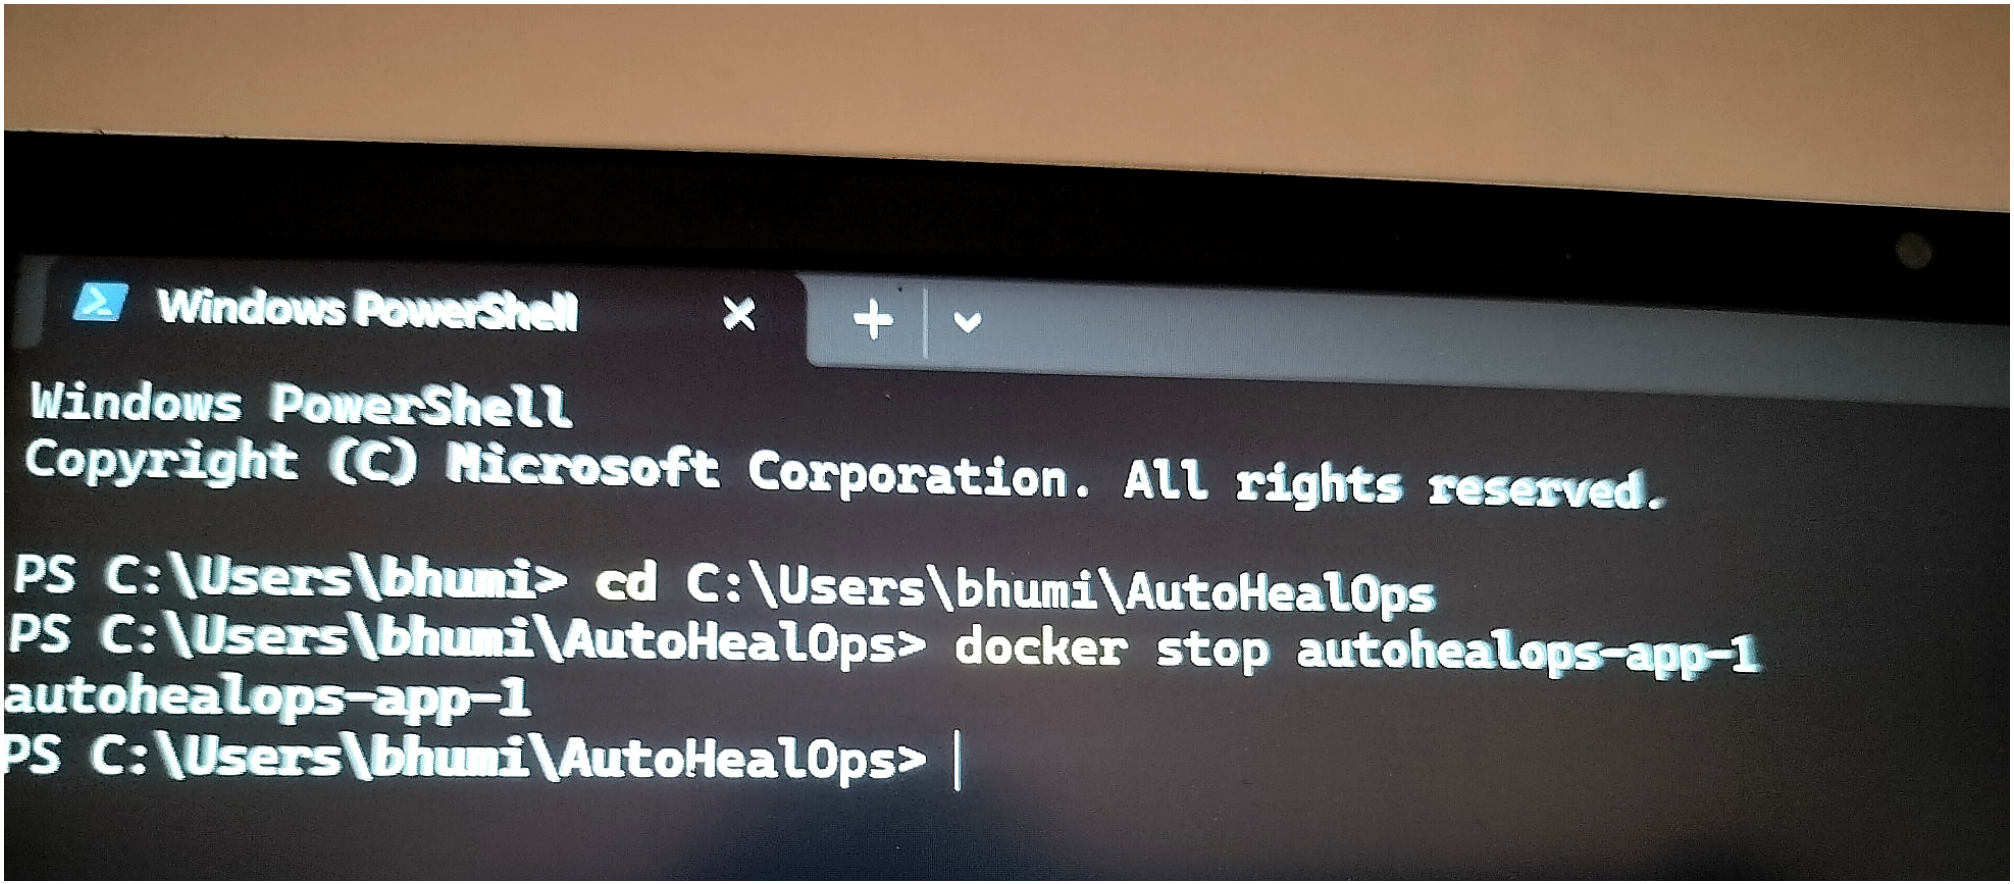

07. Watchdog Startup

PowerShell output showing AutoHealOps Watchdog Started and App Status: HEALTHY.

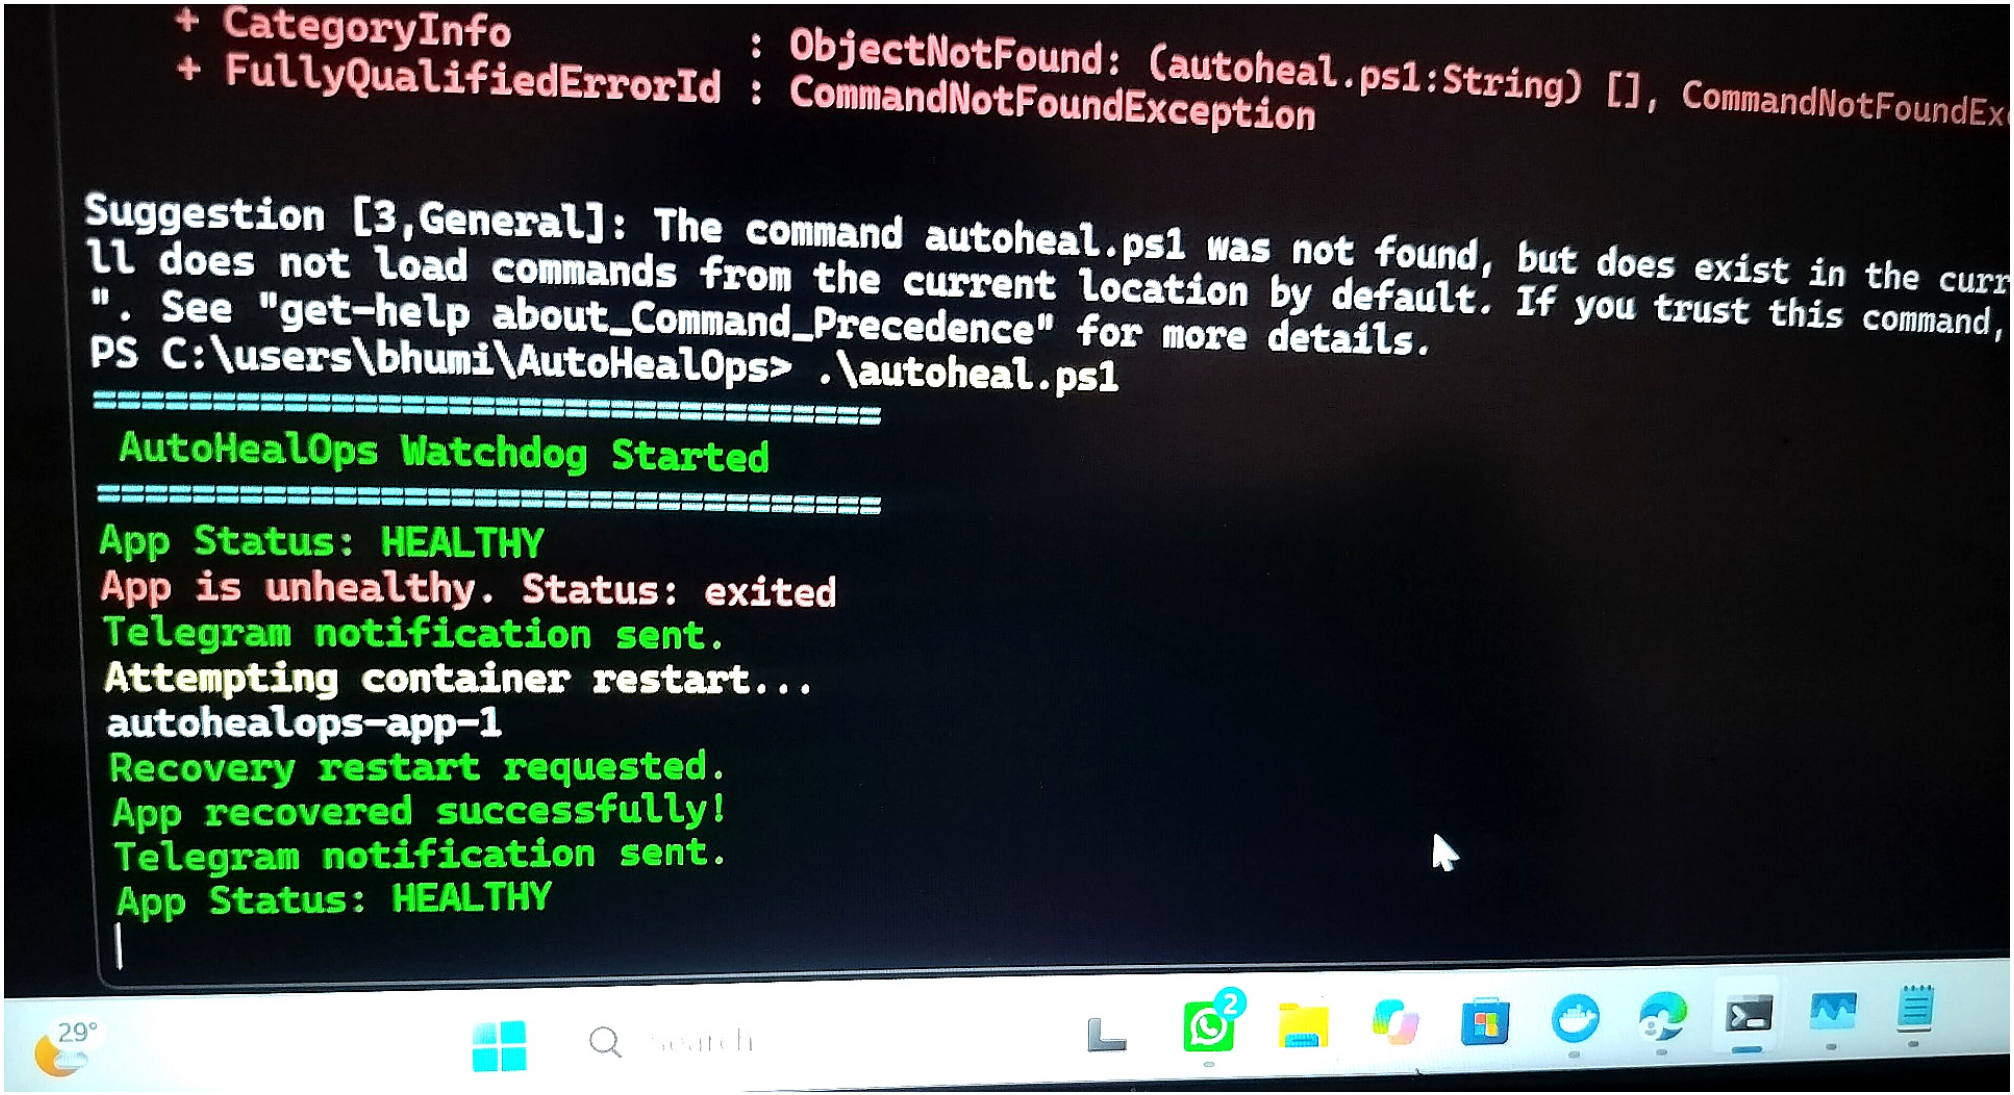

08. Container Stop Test

Actual command used for the controlled failure test: docker stop autohealops-app-1.

09. Automatic Recovery Evidence

Watchdog detects the exited app container, requests a restart, reports successful recovery, and confirms the app is healthy again.

10. Telegram Alerts and Recovery Notifications

Actual Telegram bot conversation showing the app-unhealthy/recovery-started alert and the recovered/healthy-again notification.
